## 3 Preprocessing

This part of the report presents the results of the preprocessing process. It contains required, as well as non required, steps listed below.

Required preprocessing steps:

• Missing data imputation

- Removing columns with 100% unique categorical values
- Categorical features encoding
- Scaling
- Removing columns with 0 variance
- Detecting highly correlated features

#### Additional preprocessing steps:

- Feature selection methods: Correlation with the target or Random Forest feature importance
- Dimention reduction techniques: PCA, VIF, UMAP

Preprocessing process was configured to select up to 3 best unique preprocessing pipelines. Pipelines were scored based on a simple model. Tables below show detailed description of the best pipelines as well as all step combinations that were examined.

## 4 Modeling

#### 4.1 Overview

This part of the report presents the results of the modeling process. There were 5 classification models trained for each of the best preprocessing pipelines.

The following models were used in the modeling process.

- LogisticRegression
- GaussianNB
- SVC
- $\bullet$  DecisionTreeClassifier

#### 4.2 Hyperparameter tuning

This section presents the results of hyperparameter tuning for each of the best 3 models using RandomizedSearchCV. Param grids used for each model are presented in the tables below.

Category	Value
n_neighbors	[5, 10, 15]
weights	['uniform', 'distance']
algorithm	['auto', 'ball_tree', 'kd_tree', 'brute']
